

# What is Renewable Propane?

- Renewable propane is a byproduct of renewable diesel, made primarily from plant and vegetables oil, animal fats, or used cooking oil.
  - Recently, more and more renewable propane is being produced from the seed oil of the camelina plant.
- Renewable propane is chemically identical to conventional (fossil) propane.
- Carbon intensity is much lower than conventional propane since it is produced from bio-based or renewable sources.

# Renewable Propane in the Transportation Market

- The number of vehicles that operate on propane autogas, such as forklifts and fleet vehicles, is expected to increase.
- Operators can now use renewable propane as a “drop-in” replacement fuel without any changes to the current infrastructure.
- There is an increasing interest in renewable propane due to its near-zero-emission levels and reduced greenhouse gases.
